**Intelligent Micro Patterning Announces Two New Products:
the SF-100 ELITE and the Linear Coating Platform**

Intelligent Micro Patterning, LLC, St. Petersburg, Florida, announced two new products today, the SF-100 ELITE maskless exposure system and the Linear Coating Platform.

The SF-100 ELITE system utilizes the SF-100's best features and then adds more precision into the system design. The SF-100 ELITE is a unique, maskless photolithography system that utilizes patented Smart Filter technology, licensed by Intelligent Micro Patterning, LLC from the University of South Florida. Smart Filter technology incorporates proprietary, cutting-edge, micro-optical techniques to rapidly project master images directly onto diverse substrate materials. The SF-100 ELITE then adds highly precise substrate movement and an inline, confocal camera system to improve overall system results, especially when patterning fine features. Additionally, unique substrate handling has been added for microfluidic researchers.

The Linear Coating Platform is a simple, easy to use coating system for doing both dip coating and liquid spraying onto non-standard or high topography substrates. These two technologies are available on a single platform, which provides a small footprint, highly flexible coating system. The platform is fully computer controlled, so that process results are repeatable and the system is simple to operate. Movement is available 2 dimensionally, so large area substrates can also be coated.

Dr. Jay Sasserath, the Company's Chief Executive Officer, stated, "Both of these new products are a result of the requests of our customers. These technologies enhance our current product line, by producing improved patterning results and expanding our processing capabilities. As with all of our products, the SF-100 ELITE and Linear Coating Platform provide easy to use, versatile capabilities that allow standard photolithography processes to be used in unique, non-standard ways. We look forward to these new products providing further financial growth for our company and expect to announce initial system sales shortly."
